### **MFE CYBER SECURITY WARNING**

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To the Ministers of Environment.

I write regarding the aerial spraying which leave white trails in our skies, sometimes in random patterns, and sometimes in criss-cross patterns.

Significant International scientific research identifies them as chemtrails – unnatural emissions being deliberately released from aeroplanes' nozzles.

Whether it is toxic or not, or whether they are the infamous chemtrails, there can no longer be doubt that something is being released via aerial spraying, and is supported by the government.

My questions therefore are:

1. What are the chemical compounds being released, regardless if they are toxic or not, intentionally via aerial spraying?

2. How do the residues of these compounds affect:

- human inhalation,
- Animals including stock, and agriculture
- Plant life including cropping and horticulture

- weather patterns and 'climate change'?

3. Who is responsible for these sky trails? Flight paths have apparently been mapped. Some flights are not on the flight path radar.

4. Why is this being done over communities and rural areas throughout New Zealand?

I note on the Ministry of Environment website mentions air quality. If these trails in the sky are toxic, then it brings into question the quality that is expected and accepted.
