MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Michele Bourke

To whom it may concern,

I am concerned about the decline in the condition of our drinking water, we all should have access to clean uncontaminated drinking water and in saying this I mean water in its natural state, not contaminated with nitrates, chlorine, fluoride, or anything else. We had some of the purest natural water in the world, it is our job as guardians of this land to protect these natural resources so fundamental to all of our wellbeing. Our government has the power to make these positive changes, I live in hope they will do the right thing.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

Kia ora,

I am a young person living in Lyttelton, Canterbury. I am passionate about protecting nature and ensuring wellbeing of all people. I'm very concerned that too much nitrogen in our drinking water will affect our health. I don't want the health of people to be damaged for economic gain. We need to move away from intensive farming for the health of our land, the health of our waters, and the health of our people. Water affects everything and everyone.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

There is also growing scientific evidence of a dangerous correlation between water contaminated with nitrogen and the increasing incidence of bowel disease, particularly in the Canterbury region. We cannot afford to have higher rates of inflammatory bowel disease and bowel cancer in this country. Dairy farming pollution in our water supplies is a serious public health issue. I have witnessed some Dairy farmers in my region (Northland) providing rudimentary fences a few feet from the degraded river banks they have created with their intensive farming over many years, and not even planting a riparian zone.

This shows a priority of profit over protection of the land for future generations, and an almost total disregard for the waterways.

Please act to safeguard clean drinking water, so that all of us can thrive.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I was in Hong Kong and saw how sea pollution caused havoc to a "round the world" Yacht race. The yachts were trapped in an "island" of plastic. They had to be rescued by tugs sent from HKG. HKG is no longer a port used by Yacht race organisers. I think that they are using a port in Vietnam, probably Ha Long bay or Cam Ran Bay.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Robert Bensch

2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Jake Dale

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

I find it astounding that we live in a country where access to clean drinking water is not the norm. Everyone should have access to clean and safe drinking water. People should not be suffering adverse health impacts, including cancer, from water that comes from their taps. Businesses should not be profiting from actions that harm our environment and public health in that way.

We are trying to support too many cows by applying too much synthetic nitrogen to our farms. The runoff from this system and its leaching into our groundwaters contaminates drinking water throughout Aotearoa. Ironically the most impacted people are rural communities - farming practices are harming farmers and their neighbours.

The Government's current proposals are insufficient to fix this problem.

To ensure healthy water for all I call on the Government to:

1. End new dairy conversions - we cannot allow this problem to get worse.
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Phase out synthetic nitrogen fertiliser through a sinking cap. This cap must be responsive to scientific evidence about nitrogen levels and their health impacts. Particularly in areas where levels are high the cap must sink faster.
4. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

The economic system of farming must respond to the health needs of its community. When nitrate levels are too high, they must be substantially reduced.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Kyle Matthews

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Eric Staelens

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Water is New Zealand's most essential resource both now and in the future. We have a moral and possibly soon, legal responsibility to maintain this for future generations.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

To whom it may concern,

I ask you to please ensure everyone's access to safe drinking water. To me, this seems to be a human right, and I was shocked to learn it is not guaranteed. Please change this by taking action on contributors to water pollution.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

Nga mihi,

Nellie Potter

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

For New Zealand, a so-called developed country to have contaminated drinking water for its citizens is a national disgrace and one that politicians should have addressed years ago.

But instead they bent to pressure from lobby groups and allowed too many cows and too much synthetic nitrogen fertiliser to overload the natural systems. Cow numbers and the use of fertilisers are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To whom it may concern,

I completely agree with the points made below by GreenpeaceNZ. I have now lived in NZ for 37 years and over that period have witnessed the rapid degradation of so many rivers and lakes. I have always been critical of the "clean and green" image that NZ has projected to the world. It has been increasingly untrue and to a large extent because of deteriorating water quality. Of course, if we limit stock numbers and reduce synthetic nitrogen fertilizer applications, we also greatly help mitigate climate disruption as both are major sources of greenhouse gases. Please take strong action to polish our tarnished image and make a safer world for all (including indigenous biota).

To whom it may concern, The closing of synthetic fertiliser factories in NZ must now be considered as farmers adapt and move forward to more sustainable farming methods. I am having to purchase our drinking water as I live in a area where farming is predominant. Last I heard, bowel cancer rates are high in both Waikato and Canterbury. The acceptable rate of nitrate is far too high.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern, I get water from my tap because I believe it is safe - so far it has been. I don't need to boil it before I drink it.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

Nga mihi,

Audrey Henden

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I am concerned about declining fresh water quality in NZ, including drinking water. The decline, as you know, is closely linked to intensive agriculture and synthetic nitrogen use resulting in contamination of groundwater with nitrates and faecal bacteria.

It is a serious concern that New Zealand, with its natural advantages, is not able to provide safe drinking water. We have already seen the outbreak serious illness related to faecal bacterial contamination. More insidious but no less serious is the putative link between nitrates in drinking water and colorectal cancer.

Colorectal cancer is one of the major causes of cancer-related mortality in New Zealand is becoming increasingly prevalent amongst younger people (age <50). There is strong circumstantial evidence that this is due to environmental factors of which nitrates in drinking water is at the top of the list of suspects.

The proposed limits on synthetic nitrogen use/levels will only be sufficient to prevent escalation of the current problem, they will not be sufficient to improve water quality and safety.

New Zealand needs to wean itself off reliance on its current dependence on synthetic nitrogen fertilisers and intensive agriculture. this is not only damaging the environment, it is also damaging the health of the population.

Please act to safeguard clean drinking water.

To whom it may concern,

Healthy Water For All

It's difficult to fathom why we, the people of Aotearoa, have ignored the years of solutions offered to keep our waters safe and sustainable. It is not rocket science that to pollute our land and seas kills...and that we are in that killing line. Nature will come back, but we, as its extractive inhabitants, may not.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

John Jukes

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

Nga mihi,

Peta Feral

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

The issue of healthy drinking water is a fundamental one for our society. However, my concern for our drinking water is not isolated from the concern for the entire ecosystem. Healthy water, healthy life. But NZ must also acknowledge and act on the reality that 1kg of meat takes 10 000L of water to produce! It is a staggering amount and much much higher than an equal nutritional content via plant based foods. The nitrates which are poisoning our rivers, aquifers and ruining the healthy soil ecosystem are ALSO massively contributing to climate change emissions. Lastly, treated wastewater is being dumped into the ocean rather than being reused on crops like everywhere else in the world due to the misjudged regulations of a single company. Water is vital and it's vital we have good regulations around it.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Phil Twigge

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern, while living for 40 years in Cashmere, Otautahi Christchurch, we enjoyed artesian water hundreds of years old, filtered from the Southern Alps. As more intensive dairying practises were brought into Canterbury, these precious aquifers were spoiled gradually. Now living in a smaller city of Whakatu Nelson, we have 2 water tanks with more rainfall here. One filtered for the kitchen, the other for the garden, unfiltered. Every new home should have a water tank from the plentiful rain.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I live in Auckland now but I grew up in North Canterbury. The Hurunui River was our whitebaiting river, our picnic and outings river, our swimming hole river. Now it is so polluted that nobody lets their kids swim there any more. Why is the pursuit of private wealth allowed to destroy a precious environmental resource and social amenity? This no longer farming. This is greed.

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Bert Van Dijk

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Excessive fertiliser application leads to over-stocking, leads to polluted waterways and groundwater. Limits on nitrogen fertilisers and eventual phasing out will gradually restore a healthy balance to our agriculture and reduce poisonous run-off. Please act now!

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern, I'm sick of this government saying they are going to improve things when we all know it is getting way, way worse. Look at what farmers around the Mackenzie Country are doing with mass intensification and mass pollution around their neighbouring waterways. It's a total disgrace and we all deserve far, far better. Actions speak louder than words so do something. Shame on you all for getting bought off by these lunatic cockies. Clearly you are afraid of them. Gutless bastards

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Julianne Blanks

To whom it may concern, As a farmer I understand how and why nitrogen is promoted by big fert companies. It is up to government to control its safe use. When I first went farming urea was hardly used, we can farm in ways that don't harm our environment but big fert and intensive farming practices must be controlled.

End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Bruce Bell

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.

To whom it may concern

As a citizen, parent, grandmother and teacher, the living standard of any country in the world is judged by the quality of water not by GDP. As stated by WHO.

The effect of our current water quality upon babies and their development is a matter of grave concern. This has long term ramifications for society and its cohesion. We need clean water.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Michael Kemp

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Delicia Burnell

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.

To whom it may concern the use of so many cows is something that concerns me as cows milk is not made for humans, it is made for calves. It is also not good for human consumption. Therefore to clean up our water ways get rid of all the cows and put trees around all water ways then the water would go back to be normal.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Anasuya Lerwill

To whom it may concern, Surely to goodness, it is a basic Human Right that everyone in NZ, regardless of where they live, MUST be able to source uncontaminated drinking water. I believe we have the necessary skills to provide this uncontaminated water. The sources of contamination need to be found, communicated to NZers, & eradicated. YF, Jan Randle

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To the minister

Healthy Water For All

Any reform of the management of the 3 waters in NZ will be meaningless unless it tackles synthetic nitrogen fertiliser; one of the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Gary Gear

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I am the daughter, granddaughter and great grand daughter of farmers:sheep and dairy I understand the need to make a living from the land. I support sustainable farming practices. Our current farming system relies largely upon nitrogen fertiliser which is poisoning our waters, having been released through cow urine and alternatively finding its way into our water systems and aquifers.

This is gross negligence of the health of waterways for our future generations.

I lived in Canterbury 2008 to 2013 and the Canterbury Medical Officer of Health was warning then that our babies are the canaries in the mine, since they are in danger of 'Blue Baby Syndrome' from highly nitrogenated water used in infant formula. I have written to the newspaper and to the Minister of Health.

We all deserve to be able to drink the water that comes out of the taps. And we have a responsibility to care for this precious resources for our future generation.

Healthy Water For All

2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Kirsty Clayton

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer or suffer other negative consequences - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

But there are many other contaminants. Lead from old pipes and more recent fixtures is a problem also.

Our water systems are interconnected. New Zealanders rely on both groundwater and surface waters for supply of drinking water. Sick rivers lead to sick people, but bore water supplies are also at risk.

To ensure healthy water for all I call on the Government to:

1. Fund vital research to establish water quality baselines for surface and groundwaters.
2. Phase out synthetic nitrogen fertiliser where necessary.
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination from all sources.

Please act to safeguard clean drinking water, so that all of us can thrive.

Nga mihi,

Mike Palin

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern, I am deeply concerned that the present Govt and all previous Governments have yet to step up to the mark of the trust we have expected of them to immediately improve the quality of our waters of New Zealand in providing clean safe water for drinking by simply tackling the problem of nitrate fertiliser entering the water supply across the country. I've seen many farmers achieve this and I expect the Govt to act now on all lazy farmers who are too slow to act on this issue of extreme necessity.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I have to drink water every day if I want to stay alive and healthy. I don't have a choice.

You have a choice when deciding on rules for protecting water sources. Please put some real limits on industrial dairying and on synthetic fertilisers - the science is clear on the need for this.

I don't want my mokopuna looking back and asking why we didn't do anything about the increasing pollution.

What would we say?

Please, please make significant decisions to protect clean drinking water, so we can all thrive.

Nga mihi,

Steve Langley

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Pieter Bode

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I live in Waitaha/Canterbury. I am acutely aware that bores in this area are unsafe. Nitrates are also coming in under the Waimakariri to pollute the deep artesian system that our city has been proud of.

Please change the law to ensure we can drink this water in the future.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

New Zealand has resources, which are worth protecting. Working in agriculture in Switzerland I see many solutions like agroforestry, permaculture, small live stock, mob grazing or CSA's producing direct food for people, which are adaptable to New Zealand. For your and your children's future: try new ways with less cows and no fertilizer. Now! Is the time to change direction! If you're still hesitating: have a look into the new IPCC report. Thank you

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Shane Solomon

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.

2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

Nga mihi,

Evie Walker

To whom it may concern,

PLEASE LISTEN TO OUR PLEA - THIS IS OUR VERY EXISTENCE

With GRATEFUL thanks - Alison

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

Kia ora,

I think everyone should have access to clean and safe drinking water and trust whanau won't get sick drinking their tap water.

My understanding is that intensive dairy farm practices using synthetic nitrogen fertiliser cause most rural water pollution, and the end results is contamination of drinking water sources.

I don't see the Government's current proposals as adequate to fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils

I also support the following principles:

To whom it may concern,

I have listened to the interviews with Kathryn Ryan during her RNZ National programme. The principles seemed sound but they have led to huge disagreement, especially from greedy Aucklanders. Cutting back from that grand plan, let's get the drinking water safety sorted at least.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Selling too much of our water overseas to honour commitments made by a reckless National Government under John Key. Too late to stop that but NO MORE. And

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser quickly through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Our ground water, which many of us in New Zealand end up drinking, is increasingly contaminated by nitrogen from synthetic fertilisers. This contaminant has well-documented detrimental effects.

As synthetic fertilisers are supported by commercial interests, research into deleterious effects on the environment and public health falls to government agencies and universities, who have many priorities to balance.

Alternatives are seen as fringe, and not investigated as deeply as they could. These include natural methods of soil enhancement more commonly found on Organic farms, and methods that reduce concentrations of urine from livestock passing through the soil structure into ground water.

The NES-DW should include drivers/imperatives that encourage alternatives to synthetic fertilisers that demonstrably improve yields, and so are made attractive to commercial interests to promote to farmers, their customers.

The changes to the NES-DW must therefore be accompanied by funding of research into viable alternatives to synthetic fertilisers.

Please act to safeguard clean drinking water, so that all of us can thrive.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Ugo D'Altri

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Making rivers/ waterways protected by keeping the public a certain distance away, with 'protected/public prohibited signs on walkways ,at least as well as forestry if we wanted to think cheap.

Restricting cows.and/or protecting cows..

More education on synth.nitrogen fertilizer..would'nt it be simple enough to claim as toxic and ban the purchase, has it been tested properly in the first place..??

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

To whom it may concern,
it sounds' strange we are here again. Trying to conversely educate the majority who exercise due delligents' safe working practices' health and safety. Now with globalist doing too late too little to our local communities from foreign continents' more unsteady with pandemics' and wars' intent on sending refugees rather faintly to NZ. Another Tax.

I am confused still after Two World Wars' the height of The Cold War and a hardline from our Australian neighbor moving our peaceful nuclear free stance lost with the 2022 Nuclear Stealth Bomber America Pact loosing focus on Mankinds' humanity of the Science choosing Bullets instead of Polls'. Ballots' freedom missing in action is freedom denied.

Now record warm humid temperatures' as a result of loosing focus on the task set for us is loud and leery in my head.

Even Oak tree becoming extinct besides the Glaziers' retreat is so loud so colourful.

Oddly Solar Panels with installation from resent memory is expensive with Abundance of Sunlight. Rainy season during Winter is actually that bad. Record dry seasons'. Christian are as we all were brought up in Church are very good at passing the baton. Dry seasons, less snowfall & raising ocean levels'. To stare nature with nature would be very interesting being a farming family from the Pacific. The hand we have been dealt is night to say the least. Major changes' regarding eating food require fresh water most important.

4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

To whom it may concern,

National freshwater policies are based on the principles of Te Mana o te Wai. This means, all decisions around streams, rivers, lakes and aquifers must ensure the health of the water, which maintains the health of the people. I'm calling on you to safeguard clean drinking water by:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Action on the overloading of dairy cows on dairy farms should have been curtailed years ago. A lot of farmers are waiting to be forced by govt action to make the move because in the meantime they are profiting, this last summer's milk prices being a good incentive to do nothing. Take the action that should have been taken long ago. Years ago one third of the cows that are now grazed was recognised as being usual safe practice. I, a member of Friends of Golden Bay, highly involved in measuring fresh water quality and am disgusted at Tasman district reluctance to act. They are more interested in pleasing business owners which is why national law and action is imperative.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Dairy cow urine and synthetic nitrogen fertiliser are the main causes of nitrate water pollution, including contamination of drinking water sources in Aotearoa. The link between bowel cancer and nitrates has been established by national and international science.

The New Zealand Federation of Freshwater Anglers has been testing Canterbury surface and ground water for several years now and can confirm that all are typically ten to twenty times higher than the national average with many exceed the MAV of 11.3mg NO₃/l.

Colorectal cancer studies have established strong correlation between the cancer and nitrate levels of 2mg NO₃/l.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies. Indeed, it is so bad that in some areas, such as Hautapu where Fonterra spray leachate onto paddocks, Fonterra supply local households with bottled water, because the ground water has been polluted by nitrate infiltration. Fonterra have been given a consent to poison people and Government after Government promotes the economic growth over the welfare of its people. It is nothing short of a disgrace and a crime.

Otago University (Dr Tim Chambers) has developed a spatial plan showing the correlation of high nitrate levels in drinking water with colorectal cancer in rural NZ.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap.
2. End new dairy conversions.
3. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils, such as Canterbury.
4. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people.
5. Stop all irrigation schemes that enable intensive dairying, including the CPWS, MHS, BCS, Hakatamea, RDR.
6. Internalise the cost of pollution - make the polluters pay as per the 1983 Rio Summit commitment made by NZ. It is wrong to expect the tax payer to continue to bail out polluting industries by funding shams such as the Freshwater Improvement Fund.

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.

2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.

3. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

Regards

David Haynes

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are two of the main causes of water pollution in rivers and streams, and of drinking water in Aotearoa. Rural people on household bore water supplies are hardest hit by this, but everyone on town supply needs water that has been treated for organic residues as well as mineral pollution.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Lauren Leigh

To whom it may concern,

The issue of safe drinking water is as vital as clean air to breathe. Our country could do so much better in both areas but clean drinkable WATER is crucial!

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Angela Bradley

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.

To whom it may concern,

Healthy Water For All

When I drive through areas which have been converted from sheep/beef farming to intensive dairy, I see the previously clean rocky rivers with rocks covered in green slime. Unlike the unseen nitrate in our drinking water, the green slime is not so easy to ignore. Please ensure intensive dairy farming is brought under control. Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I grew up swimming in the beautiful water of the Motueka River. This was a highlight of my childhood, with the river seen as a safe and protected space for recreation and relaxation. I fear that this luxury will be taken away from many children, who live near water sources that are not fit for swimming or drinking.

Everyone should have access to clean and safe drinking water. Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Kate McLaren

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Tyreena Cook

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Good Health

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern, the Labour government should leave a proud legacy of improving for the first time, our precious rivers. We grieve the loss of swimming places such as Coe's Ford where we took our children for a joyous day of picnic and water play, while our grandchildren are left with a slimy trickle of cow poo. We blame the National party for prioritising profits over health.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Firstly, Government should make statutory provision for any residential owner to install their own tank water collection (with suitable filtration) system and to opt out of the public drinking water supply and all associated charges.

Secondly, too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people
4. Change legislation for the provision of residential owners to install independent water collection systems and opt out of public water supply & associated public charges.

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa. We have known this for years and our country and government has had enough time to have already sorted this issue out but here again we plead/demand change.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Paul Oconnor

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern, why would we not clean up our rivers!?! It can be achieved as I've seen in parts, just did walk outside of matamata! It was beautiful and sad to actually see what they should look like!! We need to be looking to the future, if we don't have clean water ways we are doomed!!! Clean water is essential, we need it for all to survive!! We are a beautiful country so why is this not a priority and why are we destroying them!!? Greed and ignorance are not a good combination!! NO EXCUSES

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Please

We must have access to healthy drinking water, storm water must be controlled and our rivers must be protected from over farming, the uses of synthetic nitrate fertilisers

Many stock levels of cows are too big and use too much synthetic nitrogen fertiliser.

The 3 Waters proposal is better than what we have at present - local councils generally blow caretaking our water quality, but it is not enough

To ensure healthy water for all:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold all the principals of The Treaty of Waitangi - our partnership.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity and all other contributing factors that pollute water supplies like forestry and mining.

I urge you to take urgent action on this matter - we were once known for comparatively clean and pristine waterways, sadly that is not the case now! Time to change that before it is too late

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

In recent decades NZ farmers have made a conscious pivot from low intensity, low impact diversified farming to high intensity factory-style farming. This intentional transition has been to maximise profits from exports, and has been possible due to the unsustainable availability of the raw materials for synthetic fertilisers internationally, and to securing overseas markets for the resulting products. Dairy has been a major component of this escalation and dairy herds have grown to environmentally harmful numbers.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most immediately impacted communities are rural people on household bore water supplies, but town supplies that are typically sourced from deeper or better protected sources are only safe for the short term until run-off percolates into those sources too.

The problem is further exacerbated by the wholesale extraction of water from rivers and aquifers for irrigation to support the excessive demands of dairy production.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Mandate the phase out of synthetic nitrogen fertiliser through a sinking cap
2. End new dairy conversions
3. Introduce a stocking rate limit to reduce the number and density of cow herds. This limit must be stricter in areas with highly porous soils
4. Introduce a levy on stock numbers to cross-fund conversions away from unsustainable factory-style farming
5. Protect everyone's drinking water, including rural communities on small supplies

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water the first and most important step is protecting the source water from contamination ie. our rivers, lakes, and aquifers.
3. Stricter controls are required to reduce water takes by farmers so rivers can continue to purge the huge residue of nitrogen contamination (along with its associated payload of heavy metals).
4. Willing farmers deserve assistance to transition to more sustainable environmentally-friendly forms of farming that are organic and regenerative to minimise the use of synthetic fertiliser.
5. To achieve these principles the Government must urgently put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

Nga mihi,

Stephen Beuzenberg

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I want my family to continue to enjoy the beautiful water I have enjoyed previously in Otautahi and Waitaha. Sadly it's quality has decreased at an alarming rate over the past years. I am deeply saddened by this. Our water has had to be chlorinated to keep us safe, when previously it didn't require this and we were able to enjoy its freshness and purity. Now I hear it has traces of nitrate that our health specialists tell us are not good for us. Please, put in place rules to ensure we get our beautiful water back and that all in Aotearoa can access this.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Amy Edson

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I work in Morrinsville and using the tap water for drinking/cooking is impossible. No doubt it has been treated and is safe but the taste is terrible. No nice cup of tea from that. The farmers here have their own water supply from tanks and don't have to suffer that. Seems like a little injustice here.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

Please do what is necessary to stop drinking water contamination NOW To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Margaret Oldham

To whom it may concern,

HEALTHY WATER A NECESSITY

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Over 10 years ago I was involved with the Water Rights Trust in Canterbury which was advocating for a moratorium on dairy conversions. This fell on deaf ears and pollution has subsequently become much worse.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap on new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

Nga mihi,

Yelah McDougall

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I live in Christchurch. I am a 66 year old mother and grandmother. My water supply comes from the aquifers beneath the Canterbury Plains, as does my 4 children's' and 8 grandchildren's.

Because of the fact that there are 1.3 million dairy cows on the Plains, I have a real fear that our drinking water is being compromised. That the amount of nitrates, caused by cows urine, faeces and the tons of synthetic fertilisers dumped on the land is leaching into the porous soils of the plains and is creeping up to very dangerous levels.

I find it incredulous that private profit making businesses (farms) can be allowed to slowly destroy what is basically one of our human rights in Aotearoa - the right to clean water.

How can this be so?

To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.

The government must put controls on cow numbers and the use of synthetic fertilisers. And this must be done region by region, taking into consideration: soil types, geography and other specific relevant details.

We need clean water. Please act now to safeguard the water for me, my children, and my grandchildren.

Nga mihi,

Nicolette De Lautour

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Jenny Green

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I live in Invercargill. We have the Oreti river right on our doorstep. As a child I used to swim there and boating was great. I am left asking the question - will I ever be able to see the bottom of the river again in my lifetime? How do we make this happen? The most disappointing thing is - this problem is nationwide - which just screams for government intervention and policy change.

We can all see it and these are our sources of drinking water.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Chris Powell

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

This is not just a slogan, it is something extremely important because everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated. I strongly believe that we have entrusted you, the government, with that obligation and we pay our taxes to you to make sure that happens.

Too many cows and too much synthetic nitrogen fertilizer are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase-out synthetic nitrogen fertilizer through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

Für wen es sich betrifft,

sollte Healthy Water For All Everyone Zugang zu sauberem und sicherem Trinkwasser haben. Niemand sollte krank werden - geschweige denn Krebs entwickeln - weil das Wasser aus seinem Küchenhahn kontaminiert ist. Zu viele Kühe und zu viel synthetischer Stickstoffdünger sind die Hauptursachen für die Wasserverschmutzung, einschließlich der Kontamination von Trinkwasserquellen in Aotearoa. Da unsere Wassersysteme miteinander verbunden sind und 50% der Neuseeländer zum Trinken auf Grundwasser angewiesen sind, führen kranke Flüsse zu kranken Menschen. Die am stärksten betroffenen Gemeinden sind Landbewohner mit Wasserversorgung. Die aktuellen Vorschläge der Regierung reichen bei weitem nicht aus, um das Problem tatsächlich zu lösen. Um gesundes Wasser für alle zu gewährleisten, fordere ich die Regierung auf: 1. Den Ausstieg aus synthetischem Stickstoffdünger durch eine Sinkende Kappe Beenden Sie neue Milchumstellungen 2. Einführung einer Besatzsatzgrenze, um die Anzahl der Kühe zu reduzieren. Dieser Grenzwert muss in Gebieten mit stark porösen Böden strenger sein 3. Schützen Sie das Trinkwasser aller, einschließlich ländlicher Gemeinden mit kleinen Vorräten, die weniger als 25 Menschen versorgen Ich unterstütze auch die folgenden Prinzipien: 1. Jeder sollte Zugang zu sicherem Trinkwasser haben, unabhängig davon, wo er lebt. 2. Die Sicherheit des Trinkwassers gewährleisten Der erste und wichtigste Schritt ist der Schutz des Quellwassers – unserer Flüsse, Seen und Grundwasserleiter – vor Kontamination. 3. Um Te Mana o te Wai aufrechtzuerhalten, die grundlegende Bedeutung des Wassers für die Gesundheit und das Wohlergehen unserer Bevölkerung und unserer Umwelt anzuerkennen und Te Tiriti o Waitangi aufrechtzuerhalten, muss die Regierung die Trinkwasserquellen sinnvoll schützen. 4. Um all diese Grundsätze zu erreichen, muss die Regierung wirksame Kontrollen der Hauptursachen für die Wasserverschmutzung - synthetischer Stickstoffdünger und Viehintensität - einführen.

Bitte handeln Sie, um sauberes Trinkwasser zu schützen, damit wir alle gedeihen können. Nga mihi, {Name}

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Ray Miller

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I was diagnosed and treated intensively for bowel cancer last year and this year.

I want the government to take every avenue possible to prevent morbidity and mortality to our citizens from preventable cancers by seriously addressing this issue of water quality with the known link of cancer to use of synthetic nitrogen fertiliser & too many cows. For goodness sake let's make our own compost in a safe way and not spend overseas. People matter more than excess cows!

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

To whom it may concern,

40 years ago, as a medical student in Oxford, I was taught that nitrates in the drinking water there were way over safe limits and were causing cancers of the bladder and bowel. Forty years! I can hardly believe that nothing has changed except that to accommodate industrial agriculture, the "safe" levels have actually been raised. My God....

End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Dawn Hosking

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Deborah Crossan

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I used to work at the University of Waikato under Professor David Hamilton who was at that time, Chair of the Rotorua Lakes. I analysed water from the lakes and other freshwater bodies around New Zealand.

In spite of the best efforts of many dedicated people and scientists alike, it was always with a heavy heart that I passed on reports to Professor Hamilton that showed a year-on-year deterioration of our fresh water.

The level of nitrates in the water was always alarming. So many lakes in NZ are now in what's called a eutrophic state - over supplied with nutrients from nitrate run-off from dairy farms. Many of them are now classed as hyper-eutrophic; sick, dead lakes - dangerous to both humans and animals.

These are inescapable, undeniable facts.

Dairying in NZ has polluted the fresh water bodies. The industry fiercely denies the level of damage it continues to cause and has unacceptable sway in government in regards to watering down and delaying important legislation designed to lessen and eliminate the frank pollution.

This is so unacceptable - nothing is more important than clean water....even money which is the sole driving force behind the protectionism.

This affects our drinking water. It's not right.

Please act to safeguard clean drinking water, it is more important than ever.

Louise Stewart

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

To whom it may concern, I find it insane that this is even something that needs to be said, of course safe drinking water is a human right and in NZ we are capable of making it happen. It should be protected to the highest level based on the latest medical science. Dairy is big business in NZ and the economy will have to adjust but I believe long term it will be worth it for our free health care system.

End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

John Baxter

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern, This is important to me , because with the impact of climate change bringing widespread floods in some areas and drought to others our water supplies are endangered further. We cannot control the weather, but we can control what we put on the land and how many stock we run. Artificial fertiliser interferes with natural soil regeneration as has been proved in the USA many years ago resulting in the creation of large areas of infertile soil and dust bowls

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Adam Crisp

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

When I was growing up - admittedly 60 years ago, it was possible to swim in and drink from practically any waterway in NZ. With the advent of intensive dairy farming in the southern part of the South Island approximately 20 years ago this situation rapidly reversed so that now these waterways are virtually toxic. Fish - even eels, can no longer live in them and swimming in or drinking from them is absolutely out-of-the-question. Dairying may be one of NZ's economic mainstays, but the current practices are demonstrably wrecking the ecology and the price being paid for this economic success is far too high. For the sake of future generations and the wellbeing of all aquatic life the governing bodies - both at local and at national level, have to take urgent action. Currently there is a lot of talk about various actions being taken or proposed to rectify the damage which has occurred, but vested interests, both personal and political, appear to be preventing this from happening.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern, we all need and must have a clean and affordable safe water supply

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I am mortified that the New Zealand government knows the science being nitrate levels in our drinking water and the link to our terrible cancer rate. As soon as I read about studies in to it I tried frantically to find out the levels in my local drinking water and an affordable filter for my kitchen sink. Unfortunately neither are available. So for the health of my children and the New Zealand citizens you represent and serve, I implore you to make it water safe as laid out below.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

To whom it may concern,

I am mortified that the New Zealand government knows the science being nitrate levels in our drinking water and the link to our terrible cancer rate. As soon as I read about studies in to it I tried frantically to find out the levels in my local drinking water and an affordable filter for my kitchen sink. Unfortunately neither are available. So for the health of my children and the New Zealand citizens you represent and serve, I implore you to make it water safe as laid out below.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

Nga mihi,

Kathryn Feisst

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Sarah Granich

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

it is hard to believe that it has become so hard to make a living out of dairy farming that our farming community has been forced to rely on such measures as over-stocking, which leads to the need for these nitrate fertilisers.

I remember my uncles owning a dairy farm when I was but a young lad, some 55 years hence, when all that was needed was rotational grazing (including turnips), hay, and the use of the good old 'super' (superphosphate).

Admittedly, still not completely natural, but a lot safer than things are now.

If these modern fertilisers are at such levels to be contaminating the groundwater, what are they doing to the humans that are using it, and the animals that are forced to ingest it, albeit at low levels, further down the food chain??

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Isaac Evans

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Claire Seguin

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Bryan Fitzgerald

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern, As a government, you concern yourselves re the covid situation, and try and minimise the impact on the health system, but what mandates have you put in place to stop the effects of nitrogen fertiliser, utilised in the dairy industry, being a health hazard as a result of being leached into our waterways and into the nation's drinking water. It shouldn't be a case of acceptable levels either, there should be NO chemicals in our drinking water, causing health issues. I haven't drunk tap water for over 5 years because of this reason.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

More action is required to effectively reduce the number of cows and too much synthetic nitrogen fertiliser being used. These 2 things are the main causes of water pollution.

Phase out synthetic nitrogen fertiliser, and introduce a stocking rate limit. This will help enormously.

Thankyou,

Raine Shirley.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Michael Trinder

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern, I live rurally and can see that reducing cow numbers is urgent - stop trying to appease the dairy agribusinesses and giving polluters extra time. They still won't vote for you and in the meantime, many Aotearoa/NZ people will defect (hopefully to Greens or Maori) or even opt out of the electoral system due to your inaction. Everyone knows that our water and the climate can't wait and conventional economic considerations have to change. There are other solutions.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Ollie Langridge

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern, When everyone in Havelock North got sick I just couldn't believe it. How could that happen in NZ from water. I remember as a kid swimming and drinking in the river and it being so clear. Now there is toxic algae everywhere in Masterton. NZ has a number of things to sort out but surely this has to be the most vital one to get right.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

Nga mihi,

Suzanne Aitken

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.

To whom it may concern,

Healthy Water For All

My wife very nearly died from bowel cancer.

SHE HAD NO PRECURSERS FOR BOWEL CANCER, none at all. Except we live rurally.

For me it is a no brainer that if we keep dumping chemicals onto our land then it will eventually leach into our streams, rivers and aquifers.

History shows that we cannot rely on governments to monitor and keep our water sources safe. The next smoking gun is 1080 Poison.....

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Dave Pratt

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

When I saw what was happening to Te Waikoropupu Springs, I felt hopeless, watching the deterioration and remembering the original beauty of his place, but of course, this is not about beauty, it is about being poisoned, we must never let down our guard because vested interests in the agricultural sector lobby for imported fertilisers. We are already too late to prevent the contamination. We need to act now to prevent it getting worse. Children growing up now, with the increased pollution, will suffer the greatest consequences.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer or other diseases - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Also there are insufficient controls on runoff from roadways, land development, leaky sewerage systems and industrial operations that enter our waterways and pollute our rivers and underground water systems.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

In addition, Auckland the nations' biggest city is now dependent upon water from the Waikato river whose water quality is under threat from poor land management practices and inadequate controls on land development.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people.
4. Introduce new regulations to reduce sediment running into our water systems.
5. Require all cities and towns to properly manage their sewerage systems to stop overflows seeping into our rivers and groundwater.

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser, livestock intensity, poor controls on land development and inadequate management of our water system as a whole.

Please act NOW to safeguard clean drinking water, so that all of us can thrive.

Nga mihi,

Lynda Jeffs

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Rebecca Wedge

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

As a NZer it seems unfathomable to think I should be submitting to our elected Government about the rights of every NZer to have access to clean and safe, clean drinking water. Our electoral processes for local, regional and central authorities are already mandated to provide safe clean drinking water. The fact that nitrates are present in anyones water represents a failure of process and a moral failure within our social structure. As a country we must rise to the challenge and see it as the most urgent priority.

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Ian Jones

To whom it may concern,

Healthy Water For All

Access to clean and pure drinking water is a basic human right; not a privilege. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

David Lazarus

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

Voor wie het ook moge betreffen,

Gezond Water Voor Iedereen moet toegang hebben tot schoon en veilig drinkwater. Niemand mag ziek worden - laat staan kanker krijgen - omdat het water uit de keukenkraan vervuild is. Te veel koeien en te veel kunstmest zijn de belangrijkste oorzaken van watervervuiling, waaronder vervuiling van drinkwaterbronnen in Aotearoa. Omdat onze watersystemen met elkaar verbonden zijn en 50% van de Nieuw-Zeelanders afhankelijk is van grondwater om te drinken, leiden zieke rivieren naar zieke mensen. De meest getroffen gemeenschappen zijn plattelandsbewoners op huishoudelijke watervoorraden. De huidige voorstellen van de regering zijn bij lange na niet voldoende om het probleem daadwerkelijk op te lossen. Om te zorgen voor gezond water voor iedereen roep ik het kabinet op om: 1. Kunstmest af te bouwen via een zinkplafond Einde nieuwe zuivelconversies 2. Voer een veebezettingslimiet in om het aantal koeien te verminderen. Deze grens moet strenger zijn in gebieden met een zeer poreuze bodem 3. Bescherm ieders drinkwater, inclusief plattelandsgemeenschappen met kleine voorraden die minder dan 25 mensen bedienen Ik ondersteun ook de volgende principes: 1. Iedereen moet toegang hebben tot veilig drinkwater, ongeacht waar ze wonen. 2. De veiligheid van drinkwater waarborgen De eerste en belangrijkste stap is het beschermen van het bronwater – onze rivieren, meren en watervoerende lagen – tegen verontreiniging. 3. Om Te Mana o te Wai te handhaven, het fundamentele belang van water voor de gezondheid en het welzijn van onze mensen en ons milieu te erkennen, en om Te Tiriti o Waitangi te handhaven, moet de regering bronnen van drinkwater op zinvolle wijze beschermen. 4. Om al deze beginselen te bereiken, moet de regering effectieve controles instellen op de primaire oorzaken van waterverontreiniging - synthetische stikstofmeststof en vee-intensiteit.

Kom alsjeblieft in actie om schoon drinkwater te beschermen, zodat we allemaal kunnen gedijen. Nga mihi, {naam}

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All. Everyone needs to have clean drinking water. Protection is needed for ALL communities no matter how small. Important steps keep rivers, lakes and aquifers from contamination. Governments around the world must have controls on primary causes of contamination—synthetic nitrogen fertilizer and livestock intensity. Please act now to guarantee clean drinking water for all. I've been advocating this in my own country for indigenous peoples.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

Nga mihi,

Joyce Frohn

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern, I have modelled nitrogen flows in dairy systems and clearly showed a rapid increase in nitrogen leaching with increased stocking rates. Fertiliser N applications drive the intensification that will increase nitrate levels in groundwater. Stocking rates should be limited to reduce these flows as much as possible.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Carol Chappell

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick, let alone develop cancer, because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because the water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap to End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils.
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people.

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water, including our rivers, lakes, and aquifers, from contamination.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
2. Introduce a stocking rate limit to reduce the number of livestock. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

Nga mihi,

Anita Schurmann

A quien le pueda interesar,

Agua saludable para todos Todos debe tener acceso a agua potable limpia y segura. Nadie deber a enfermarse, y mucho menos desarrollar c ncer, porque el agua del grifo de su cocina est  contaminada. Demasiadas vacas y demasiado fertilizante nitrogenado s ntico son las principales causas de contaminaci n del agua, incluida la contaminaci n de las fuentes de agua potable en Aotearoa. Debido a que nuestros sistemas de agua est n interconectados y el 50% de los neozelandeses dependen del agua subterr nea para beber, los r os enfermos conducen a personas enfermas. Las comunidades m s afectadas son las personas rurales con suministros de agua en el hogar. Las propuestas actuales del Gobierno distan mucho de ser suficientes para solucionar realmente el problema. Para garantizar agua saludable para todos, pido al Gobierno que: 1. Elimine gradualmente el fertilizante nitrogenado s ntico a trav s de un l mite de hundimiento Poner fin a las nuevas conversiones de productos

l cteos 2. Introducir un l mite de tasa de siembra para reducir el n mero de vacas. Este l mite debe ser m s estricto en zonas con suelos altamente porosos 3. Proteger el agua potable de todos, incluidas las comunidades rurales con peque os suministros que atienden a menos de 25 personas, tambi n apoyo los siguientes principios: 1. Todos deben tener acceso a agua potable segura sin importar d nde vivan. 2. Garantizar la seguridad del agua potable El primer y m s importante paso es proteger el agua de origen, nuestros r os, lagos y acu feros, de la contaminaci n. 3. Para defender Te Mana o te Wai, reconociendo la importancia fundamental del agua para la salud y el bienestar de nuestra gente y nuestro medio ambiente, y para defender Te Tiriti o Waitangi, el Gobierno debe proteger significativamente las fuentes de agua potable. 4. Para lograr todos estos principios, el Gobierno debe establecer controles eficaces sobre las principales causas de contaminaci n del agua: los fertilizantes nitrogenados s nticos y la intensidad del ganado.

Por favor, act e para salvaguardar el agua potable limpia, para que todos podamos prosperar. Nga mihi, {nombre}

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Janet Maker

2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Kevin H

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.

Nga mihi, BUT there is more to our water contamination than nitrates.

Over the years a whole raft of clever chemicals have been thrown on New Zealand's soil.

We all recall DDT?

Many more toxins have been used since then and what is only just being acknowledged is the sublethal levels of this mixture work synergistically. One such chemical alone may be tolerated, but 2 or more can act together and prove harmful to a range of life forms including humans

This is the Elephant in the room!

The big commercial companies cannot afford to reveal this.

Governments have a responsibility to at least identify these small contaminants and investigate their synergistic effects especially on gut flora.

Linda Pocock.

To whom it may concern,

How can NZ claim to have a 100% Pure record when it's rivers, lakes and coast are being polluted with full knowledge of the Government?

If you are serious about promoting NZ to be a place that holds the environment in the highest standards then you need to act to protect the most fundamental right to clean water, be that to swim, fish or most importantly to drink.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern, and that is asking you if you are concerned that some Kiwis are not served with clean drinking water from their taps. Please act on reducing fertilizer use in NZ

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

Nga mihi,

Aidan Kay

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I am deeply concerned with the quality of our drinking water. When I stay in my bach in Southland I buy water to drink because I am worried about nitrates in the town supply. Tuatapere is surrounded by dairy farms.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I am deeply concerned with the quality of our drinking water. When I stay in my bach in Southland I buy water to drink because I am worried about nitrates in the town supply. Tuatapere is surrounded by dairy farms.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Safe drinking water is a fundamental necessity for human existence. It is simply unconscionable for any society to think otherwise.

In New Zealand the contamination of water sources comes largely from excess dairying and excess synthetic nitrogen fertiliser. Sick groundwater systems and rivers produce sick people and the Government's current proposals to fix the problem are insufficient.

I therefore call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap.
2. Introduce a stocking rate limit to reduce the number of cows, a limit which needs to be stricter in areas with highly porous soils.
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people.

I support the following principles:

1. Ensuring access to safe drinking water for everyone no matter where they live.
2. Upholding Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment
3. Protecting the safety and purity of all sources of drinking water.

Please act to safeguard our water, to ensure the healthy existence of our society.

To whom it may concern,

Healthy Water For All

I am a water engineer (Chartered Chemical Engineer). I worked in the water business in the UK for many years before emigrating to New Zealand.

Throughout Europe Nitrogen pollution is one of the biggest problems - caused by long term pollution - mainly agricultural. Governments have been spending millions to try to bring this back under control, but it will take many decades, possibly centuries to reverse the damage that has been done.

Coming to New Zealand, I was shocked to find that we are now continuing to make the mistakes that the old world made - and the old world is now spending so much money trying to fix. NZ has no excuse for not knowing what will happen because so many countries have "been there, done that".

For the sake of all of us, and for the future health and welfare of our beautiful country, let us learn from the mistakes of others and not repeat those mistakes. It is not worth the price.

Please act to safeguard clean drinking water, so that all of us can thrive.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I support the efforts to limit the endless increase in dairy herds, the drawing on water for them, the use of palm kernel expeller cake to feed them and the increase in nitrates that overstress the soil systems.

I also support the use of residential and commercial water collection and the use of appropriate filtration so that households and commercial sites can collect rainwater from roofs and use on site for drinking and other purposes. There are many areas in NZ where an adequate supply of rainwater falls each year.

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I am very concerned about our contaminated water: the rivers and the lakes and as a result of drinking water. It is shameful. There needs to be rigorous new public health policies which address this serious problem in Aotearoa New Zealand.

There ought to be healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Johann Bernhardt

To whom it may concern,

Intensive land use has been incrementally degrading the quality of our water, in waterways, lakes and aquifers for decades. We need strong action to halt this degradation for the benefit and health of all New Zealanders.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I believe we have a right to healthy water

As someone with ongoing health issues, the availability of clean drinking water is a must. At this moment I filter my water. This is an extra expense for my very tight budget. It is important though, as I can not burden my system with any pollutants which we currently have in our drinking water. I have no guarantee I filter them all out but it is a start. I really believe everyone should have access to clean and safe drinking water and not have to filter theirs. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

We should all have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water in their kitchen tap is contaminated. And in Aotearoa drinking water sources are contaminated, to a large extent from too many cows and too much synthetic nitrogen fertiliser.

Our water systems are interconnected and half of all New Zealanders rely on groundwater for drinking, so sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

We need to urgently change the way we live and impact the earth, and the Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser and end new dairy conversions;
2. Introduce a stocking rate limit to reduce the number of cows and make this limit stricter in areas with highly porous soils;
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people.

I also support the following principles:

1. Everyone should have access to safe drinking water - no matter where they live.
2. To ensure the safety of drinking water, the first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

The area where I live and where there is are high dairy stocking and fertiliser use rates, has high nitrate levels (the Waimea Plains) currently making drinking water from wells untenable and probably increasing cancer rates in our area. This is totally unacceptable.

Healthy Water For All

End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Te-Aroha Henare

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.

To whom it may concern,

That everyone should have healthy water is a no-brainer. My question is: what motivates the government to NOT make sure this is happening, to allow it to NOT happen???

Let's get honesty back into politics!

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Desmond Darby

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

It is absolutely essential that we end intensive dairying to protect our water and our planet. Farmers who have converted to diversified, non-industrial farming have consistently found that their profits have increased whilst the health of their land and waterways have greatly improved. However, the speed of change is too slow, and strong regulation is now imperative.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern, it is well known that drinking water may contain metals from taps which cause chronic or acute poisoning. The EPA has set maximum contaminant levels for metals including arsenic, barium, cadmium, chromium, lead, copper, mercury, selenium, nickel, thallium, antimony, and beryllium. Now it appears that we also have to worry about high levels of nitrates. ENOUGH IS ENOUGH!

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Rodney Hylands

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water is #1 essential requirement for Human Well-Being

Everyone should have access to clean and safe drinking water. NZ could dramatically reduce toxins in the environment that are conducive to cancer and other illnesses by ensuring the water from kitchen taps is not contaminated.

Health depends on good quality drinking water which should be a priority in every part of New Zealand for all New Zealanders. This is only possible through strict central government policy and regulations carried out by City and regional Councils.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa. In addition, this overuse of artificial fertiliser and nitrates, plus high density cows on the land produces NZ's major methane emissions increasing the Climate Crisis.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem. Healthy water is actually more important than increasing profitability of dairy farms.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

It is vital that NZ farmers are given assistance and incentives to protect and restore the health and mauri of the soil, water and air. Profitability no longer justifies pollution of our waterways.

Please act to safeguard clean drinking water, so that all of us can thrive.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Gloria Calcutt

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I have chosen to make a submission to the New Zealand government to ensure our water systems are returned to their healthy, sacred state. All water systems have the inherent right to be considered sovereign and deeply respected by humanity. Let us show the world that we can make this happen, to restore the health of our nation and our contribution to the earth.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

To whom it may concern, stop the toxic dumping in our rivers and streams Stop putting 1080 into our bush and water ways. Common Sense needs to be used and Human Rights

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

Für wen es sich betrifft,

sollte Healthy Water For All Everyone Zugang zu sauberem und sicherem Trinkwasser haben. Niemand sollte krank werden - geschweige denn Krebs entwickeln - weil das Wasser aus seinem Küchenhahn kontaminiert ist. Zu viele Kühe und zu viel synthetischer Stickstoffdünger sind die Hauptursachen für die Wasserverschmutzung, einschließlich der Kontamination von Trinkwasserquellen in Aotearoa. Da unsere Wassersysteme miteinander verbunden sind und 50% der Neuseeländer zum Trinken auf Grundwasser angewiesen sind, führen kranke Flüsse zu kranken Menschen. Die am stärksten betroffenen Gemeinden sind Landbewohner mit Wasserversorgung. Die aktuellen Vorschläge der Regierung reichen bei weitem nicht aus, um das Problem tatsächlich zu lösen. Um gesundes Wasser für alle zu gewährleisten, fordere ich die Regierung auf: 1. Den Ausstieg aus synthetischem Stickstoffdünger durch eine Sinkende Kappe Beenden Sie neue Milchumstellungen 2. Einführung einer Besatzsatzgrenze, um die Anzahl der Kühe zu reduzieren. Dieser Grenzwert muss in Gebieten mit stark porösen Böden strenger sein 3. Schützen Sie das Trinkwasser aller, einschließlich ländlicher Gemeinden mit kleinen Vorräten, die weniger als 25 Menschen versorgen Ich unterstütze auch die folgenden Prinzipien: 1. Jeder sollte Zugang zu sicherem Trinkwasser haben, unabhängig davon, wo er lebt. 2. Die Sicherheit des Trinkwassers gewährleisten Der erste und wichtigste Schritt ist der Schutz des Quellwassers – unserer Flüsse, Seen und Grundwasserleiter – vor Kontamination. 3. Um Te Mana o te Wai aufrechtzuerhalten, die grundlegende Bedeutung des Wassers für die Gesundheit und das Wohlergehen unserer Bevölkerung und unserer Umwelt anzuerkennen und Te Tiriti o Waitangi aufrechtzuerhalten, muss die Regierung die Trinkwasserquellen sinnvoll schützen. 4. Um all diese Grundsätze zu erreichen, muss die Regierung wirksame Kontrollen der Hauptursachen für die Wasserverschmutzung - synthetischer Stickstoffdünger und Viehintensität - einführen.

Bitte handeln Sie, um sauberes Trinkwasser zu schützen, damit wir alle gedeihen können. Nga mihi, {Name}

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Yolanda Cholmondeley-Smith

To whom it may concern,

I am very concerned about the state of our drinking water in NZ.

The high level of nitrate levels is very unhealthy and is linked to bowel cancer which is killing many Kiwis.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Stephen Fullard

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Mike Howell

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern, both clean water and healthy soil are fundamental to our survival. Humankind depends on ecosystems that can guarantee these requirements for our vital future food supply. Given global warming and related environmental threats, these essential resources are under increasing pressure. Please implement Greenpeace's proposals as soon as possible.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

All of us need safe drinking water to survive. Water is life. It's a human right. It is important that we put human lives ahead of private profits by better protecting the sources of our drinking water.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
2. End new dairy conversions
3. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
4. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

To whom it may concern,

I hope the Government will have the courage to pursue the Three Waters Policy. In Whakatane we still drink water that originates in another town's sewage system. Many farmers are doing their bit to clean up their act but they need more financial help.

To whom it may concern,

Yes, there are too many cows, too many mega farms, synthetic nitrogen fertiliser pollutes the water ways, causes algae growth, and there is evidence it can cause bowel cancer and premature births.

The government needs to take strong action to stop this, deal with fertiliser companies like Ravensdown and provide some financial support and professional help to convert to regenerative pastures.

You need to take strong action to stop this and deal with

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Leigh Sullivan

To whom it may concern,

Please don't ignore our call for drinkable water for all; it's a basic human right that largely the agricultural, forestry and mining industries are ignoring due to inefficient and ineffective controls and management.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

One direct cause of our potable water pollution is that we are farming too many dairy cows and the excessive use of synthetic nitrogen fertiliser to support that intensive farming industry, is creating serious water pollution, including contamination of drinking water sources in Aotearoa. A secondary cause is that the intensively farmed soils are biologically dead, and lack the soil bacteria that would normally take up nitrogen and phosphorus contained in the urine and faeces of farmed animals.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils.
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. Provide conversion subsidies to farmers willing to convert to organic and regenerative farming practices.
4. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
5. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser, excessive livestock intensity, and farming practices that destroy the soil foodweb.

Please act to safeguard clean drinking water, so that all of us can thrive.

Nga mihi,

Ken Ross

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated. It's time to move toward a regenerative farming model that avoids using chemical fertilisers and sprays on the land that pollute and poison both land and waterways. Moving away from intensive and mono farming cultures is the only way forwards. Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Valda Kirkwood

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

I have had water filters installed so that all my water from drinking, to showers, washing, and gardening is as clean as those filters can make it. They are supposed to last 6 months before they need replacing. Yet if left 6 months the filters are absolutely filthy and the taste of the water is bad. I have ulcerative colitis in remission. I'm doing all I personally can do to ensure I have clean water. I need you, the government to do the rest. Ban synthetic nitrogen fertiliser and encourage biodiverse farms to decrease our huge dairy herds. Then we will have less nitrate in our water.

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All,

I have felt very fortunate to have lived in NZ all my life and taken delicious water from the tap for granted. As a child I had no hesitation drinking from a fresh-running stream - certainly not the disgusting open sewers of today.

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa. I come from a farming family and I despise the mindless greed that today causes the greater exploitation of livestock and degradation of the land.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Christel Bauerdick

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All. Water is a precious taonga we must conserve for future generations.

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa. This is exacerbated by exploitative greedy irrigation practices.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Central government and Regional Councils MUST act to safeguard clean drinking water, so that all of us can thrive.

Nga mihi,

Kirsty BARBER

2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people
4. Move away from economic reliance on dairy farming. It is time for the world, and NZ as an agricultural leader, to shift focus to plant-based foods and food production for the health of both people and the global environment. Intensive animal farming, with its impact on local pollution, global climate, and wasteful energy requirements, can no longer be justified for products which are over-supplied and of questionable need.

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination. The rising incidence of colon cancer, known to increase with nitrates in the diet must be considered.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Clean water is crucial for all life in New Zealand. This precious resource must not be taken for granted or wasted.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa. This is unacceptable and completely unnecessary.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap.
End new dairy conversions and encourage existing farms to become organic.
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils.
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

Thank you,
Natalie Blasco

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Tom Donovan

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

The primary role of government is to ensure that basic needs are met.

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa. Too many cows is also a significant contributor to climate change.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Byron Farrelly

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.

2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
3. To uphold Te Mana o te Wai, acknowledging the fundamental importance of water to the health and wellbeing of our people and our environment, and to uphold Te Tiriti o Waitangi, the Government must meaningfully protect sources of drinking water.
4. To achieve all of these principles the Government must put in place effective controls on the primary causes of water contamination - synthetic nitrogen fertiliser and livestock intensity.

Please act to safeguard clean drinking water, so that all of us can thrive.
Nga mihi,

Damien Losserand

MFE CYBER SECURITY WARNING

This email originated from outside our organisation. Please take extra care when clicking on any links or opening any attachments.

To whom it may concern,

Healthy Water For All

Everyone should have access to clean and safe drinking water. No one should get sick - let alone develop cancer - because the water from their kitchen tap is contaminated.

Too many cows and too much synthetic nitrogen fertiliser are the main causes of water pollution, including contamination of drinking water sources in Aotearoa.

Because our water systems are interconnected and 50% of New Zealanders rely on groundwater for drinking, sick rivers lead to sick people. The most impacted communities are rural people on household bore water supplies.

The Government's current proposals are far from sufficient to actually fix the problem.

To ensure healthy water for all I call on the Government to:

1. Phase out synthetic nitrogen fertiliser through a sinking cap
End new dairy conversions
2. Introduce a stocking rate limit to reduce the number of cows. This limit must be stricter in areas with highly porous soils
3. Protect everyone's drinking water, including rural communities on small supplies servicing less than 25 people

I also support the following principles:

1. Everyone should have access to safe drinking water no matter where they live.
2. To ensure the safety of drinking water The first and most important step is protecting the source water – our rivers, lakes, and aquifers – from contamination.
