Introduction

Organisations wishing to voluntarily monitor and report their greenhouse gas (GHG) emissions for their New Zealand operations can use these GHG emission factors.

We present the emission factors in carbon dioxide equivalents (CO₂-e) using data and methods from the 2021 calendar year.

This emission factors summary is part of a suite of documents that comprise *Measuring emissions: A guide for organisations*, listed in Figure 1.

Figure 1: Documents in *Measuring emissions: A guide for organisations*

Measuring emissions: A guide for organisations	
Detailed guide	For users who need to know the data sources, methodologies, uncertainties and assumptions behind the emission factors for each emission source
Emission factors summary	Quick look up tables providing the main emission factors for each emission source
Emission factors workbook	As above but in Excel format across multiple tabs
Emission factors flat file	Simple format for integration with software
Interactive workbook	Use this spreadsheet to input your activity data, in order to work out your organisation's emissions and produce an inventory
Example GHG inventory	Shows what a finished inventory might look like
Example GHG report	Shows what a finished report might look like

For further guidance on how to measure and report your organisation's GHG emissions, and for understanding how these emission factors were derived, see the [Detailed Guide](#).

Fuel emission factors

Table 1: Stationary combustion of fuels: Residential use

Residential fuel emission source	Unit	kg CO ₂ -e/unit
Coal - Default	kg	2.12
Coal - Bituminous	kg	2.88
Coal - Sub-Bituminous	kg	2.17
Coal - Lignite	kg	1.55
