Planting Strategy

The planting design for this project focuses on complementing the architectural form and providing amenity to the street and interior spaces of the development. A variety of specimen trees with unique underplanting mixes help to soften and frame the built form and define the three entry points to the site. The Underplanting uses a variety of species to compliment the changes in the development's facade while ensuring a consistent aesthetic and color palette is maintained along the street front. Within the interior car parking spaces, small gardens use a hardy mix of low Shrubs, Irises, dwarf Flaxes, and, Groundcovers to create simple gardens which focus on providing amenity to these large paved areas while minimising maintenance. Along the northern boundary, a changing pattern of specimen trees and underplanting is used to provide shelter while preserving views out to the landscape beyond. All species are selected to be hardy and low maintenance.
